Roundcube webmail responses. Roundcube html email problem. How do i access my roundcube email. Roundcube email help. Roundcube send html email.

I recently heard about a new webmail client from my friend Justin, who fell in love with it. RoundCube, "a browser-based multilingual IMAP client with an app-like user interface" is the latest and greatest webmail client. It's only in alpha development, which explains the jagged setup procedures, but that doesn't mean it can't kick some big squirrels. RoundCube is much smaller, scalable, and uses fewer resources than its other competitor, Zimbra, which weighs in at 150 megabytes. The interface is amazing, with lots of AJAX magic, and it's also customizable with XHTML and CSS 2 wrappers. I like RoundCube so much I'd argue it's better than Gmail. Yes, you read that right. We hope that by the end of this article you will have a fully functional RoundCube mail client on your server. Why do you want to install it? Check out some screenshots. It's as great as it looks on your server. I recommend starting with the RoundCube demo. Please note that the demo is in active use and will run slowly. It will be much faster on your server. It includes many new hybrid web programming languages, AJAX, which is an acronym for Asynchronous Javascript, and XML. A powerful feature of AJAX is the ability to send and receive small bits and pieces of data without reloading the page, resulting in clean page transitions in RoundCube. Also, AJAX in RoundCube creates a nice floating transparent banner at the top of the page when loading or displaying an error. Read this article on the adaptive path if you want to learn more about AJAX. Still not excited about RoundCube? Check out Mark Boulton's review. Before we start the installation, you will need a few things. PHP and MySQL support for your server's FTP client or other means of uploading files to your server. Access to a terminal or command line application if you need the latest version of CVS RoundCube Installation. It'll show you how to install the RoundCube CVS build. However, if you want an easier way to get the files, go to this page on RoundCube and download the latest version. If you want to continue downloading CVS, open a terminal. Copy and paste the following command into your terminal. cvs -z3 -d:pserver:anonymous@roundcube.cvs.sourceforge.net:/cvsroot/roundcubemail co -P roundcubemail Automatically downloads the latest CVS version of the "roundcubemail" folder to your home directory. If you look inside these folders, you'll see that CVS has put a lot of files and directories in different places (I counted 46) to keep track. This really slows uploads to the server, so you might want to consider removing them before uploading. For those of you who downloaded the tar.gz version, extract it with your favorite decompression tool or use the terminal command tar xzf [roundcube].tar.gz The CVS command will do it. Open the roundcubemail folder and navigate to the config folder. Here you will find two files: db.inc.php.dist and main.inc.php.dist. Rename them both and remove the .dist. Now you have db.inc.php and main.inc.php. Before we continue, you will need to edit a few things in these two files. First, you need to log into your web host's control panel to create the new MySQL database that RoundCube requires. This varies a lot depending on the host, so I can't go into detail. However, for customers using Media Temple's shared servers, you must log in to accountcenter.mediatemple.net and click on MySQL Databases in the left sidebar, then click on Create Databases. Please do not close your browser on this page as we will reuse it. In the dialog box that appears, enter the name of the database you want to use in RoundCube. When you're done, don't forget to copy the entire database name. Most web hosts, especially those on shared servers, add your website name to their database. The MySQL database login and password are usually the same as when logging in to the control panel. If not, you can contact your hosting provider who will be happy to provide you with this information. You should probably check the emails you received after you purchased your hosting first. Now we can continue editing the configuration files. Open db.inc.php in a text editor. The only thing we're worried about right now is giving RoundCube access to our newly created database. He needs to know your credentials. Find the line that says: rcmail\_config('db\_dsnw')='mysql://roundcube-pass@localhost/roundcubemail'; You will replace the part that says roundcube with your database login and send it along with your database password. Most configurations on Localhost should remain unchanged. The last thing to change is roundcubemail, replacing it with the full database name. That's all we need to edit in this file, so now we can save and close it. Open main.inc.php in a text editor and change the values below to the values I listed. We'll add a value to the default\_host parameter so we don't have to enter it in RoundCube every time we want to access email. By default, only localhost is used. The default session time is 10 minutes, but I like to keep it at 30 minutes. I found that if you write an email and try to send it after those 10 minutes, it will go back to the login page and your email will be lost. possibly a minor bug for now. The next two only change the way the data is displayed and are better than anything else; it is not necessary. Visit this php.net page for configuration parameters for date formats. The next part with the user agent is also unnecessary, but I enjoy it. The last thing to edit is the time zone. I put -5 because I currently live on the east coast, so it depends on where you live. // mail host selected to login // leave blank to display text fieldEnter a list of hosts // to display the drop-down menu, or enter the host as a string. // To use an SSL connection, enter ssl://hostname:993 rcmail\_config['default\_host'] = 'localhost'; // session lifetime in minutes rcmail\_config['session\_lifetime'] = 30; // Use this format to display a short date rcmail\_config['date\_short'] = 'l g: A'; // Use this format for verbose date/time formatting rcmail\_config['date\_long'] = 'm/d/Y g:i A'; // add this user-agent to the message headers when sending rcmail\_config['useragent'] = 'RoundCube Webmail'; // use this time zone for date/time display rcmail\_config['timezone'] = -5; Save the file and exit the text editor. Now that we've set things up, you can upload the roundcubemail folder to your web server. There are several things to consider. You can rename the folder to anything without affecting RoundCube, which is good to know because typing www.myurl.com/roundcubemail can be tedious. Renaming it to something like Mail should be fine. Launch the FTP program and upload the folder to the HTML root directory. Note to customers (mt): if you put your folder in the root of the HTML directory and name it mail.yoursite.com, roundcube will be accessible through that subdomain. See the Knowledge Base (mt) for information on how to create a subdomain. Once the download is complete, use the FTP program to change the temp and log directories to 777. This is usually done by right-clicking on the directory and selecting info, edit, or chmod. You can also change them from the command line with chmod -R 777 [dir] if you like. You are just one step away from playing with RoundCube. You need to create the tables in the database that are required for RoundCube. Go back to the open browser you had on your web host's control panel page and look for the phpMyAdmin link. PhpMyAdmin is a fantastic MySQL database management tool and is pretty much the industry standard. For the mediaClients can find phpMyAdmin in MySQL databases. When you find the link, click it and login to phpMyAdmin. A drop-down menu will appear in the left pane. Click on it and select your RoundCube database. Then click on the SQL tab. A blank box labeled Run SQL query(s) appears in the database. In this field, paste the contents of the mysql.initial.sql file located in the roundcube folder of the SQL folder. Click Go after pasting. This is what you should get. RoundCube cannot create new email users, which your host does. If you don't like the default email address given because it contains your first and last name and you want to use just your name (like me), go back to your web host's control panel. Look for the link to add a user. In most cases, simply adding that user will also assign them an email address. If you are using Media Temple, expand Email/User and then click Add User. Fill in the information on this page and click Save. The email credentials must be the name of the user you just created, and the password must be the same as the one you used to log in to the control panel. Moment of Truth You should now be able to access your RoundCube installation by pointing your browser to the directory where you placed the RoundCube folder. After the page loads, login and don't forget to include your domain name at the end of your login name. For example, your login name is yourname@jusaudomains.com. This page should welcome you. RoundCube enhancements Click Personal Settings, then click the Identities tab. Double-click the email record they have for you and add your name and any other information you want to provide and save. From there, you can click New Identity if you want to send an email that appears to be from another of your email addresses. Click on the Folders tab and create any folders you want to organize your emails. Also make sure RoundCube has the correct time zoneSettings tab. Before we go, we need to test RoundCube. Send an email to a managed RoundCube email address from another email account and try sending it from RoundCube. Everything should work fine unless your web host has PHP safe

mode enabled, which means the PHP mail() function may not work. Don't worry, there is a good alternative. Instead of using PHP to send email, you can route it through an external smtp service, which is only slightly slower than PHP's mail(). Open the main.inc.php file in a text editor and look for the following entries: // if left blank, the PHP mail() function will be used rcmal config['smtp\_server'] = ''; // SMTP username (if required), if you use %u as username, RoundCube // will use the current username to login rcmal config['smtp\_user'] = ''; // SMTP password (if required) if you use %p as password RoundCube // will use current user's password to login rcmal config['smtp\_pass'] = ''; // SMTP AUTH type (DIGEST-MD5, CRAM-MD5, LOGIN, PLAIN or empty to use // best supported server) rcmal config['smtp\_auth\_type'] = ''; Check your web host for the first item, smtp\_server, but I just used localhost and it worked fine. Update: Media Temple just responded to my request and the actual location is mail.paulstamatiou.com so it should be in the same format for other (mt) clients. The next two entries will most likely be the same as the login/password you used to log into your web host's control panel, so you can enter %u and %p. The last entry is usually best left alone, unless your web host tells you otherwise. Once you enter this information and save the file, I hope you enjoy RoundCube. Now that you have the time and opportunity to play around with RoundCube, I suggest you take a look at the catalog. At the moment it is very simple, but soon it will be possible to save and retrieve contacts in the popular vCard format and save themmore information than just your name and email address. I like it better than Gmail, which automatically adds people to your contacts if you email them once. Please note that this is an alpha version that promises much more in the future. Visit RoundCube often for new releases and development plans to see what the future holds for RoundCube. When a new version comes out, just download it and overwrite all the files in the roundcube folder except the configuration files. Make sure the temp and log directories still have chmod 777. Don't take me for granted, you may need to save temp files as well. I will probably update this article when a new version of RoundCube comes out and I get changes to update the settings. CSS modifications in the round cube folder, go to skins > default. This directory contains all the images and CSS files that define the look and feel of the RoundCube GUI. Too many things to edit so I'll just start. Open mail.css and find #messageлист tr.selected td. The background color attribute is responsible for the color of the selected letter. The default dark red is #CC3333, but I prefer blue over red, so I enter #3388CC. Save it, then open common.css and add the same color value of #3388CC to the background color of table.records-table tr.selected td and #rmKSearchpane ul li.selected. I also decided to change the 'loading' message from gray to blue. I changed the background color of the #post div.loading to light blue #AFD7F8 and the border to #3388CC. Save again. If you want to change the color of a particular color, find out what the hex code for that color might be (for example, dark gray is most likely #333333) and then search for it. Once you find it, replace it with the color you want. You shouldn't mess with CSS files if you don't know what you're doing. For example, if you want to keepThe original color is commented out, but you only use //. RoundCube doesn't load properly. The correct way to comment would be to use /\* \*/. CSS files for RoundCube are long and complex, so trial and error will take some time. That being said, I'll try to update this as I do more CSS work. I've decided to tag my RoundCube setup when customizing the CSS. By branding I mean changing the image of the RoundCube logo to something more relevant to you. I opened the roundcube.logo.gif file in the skins/default/images/ folder in my favorite Photoshop CS2. You can do the same. Edit the logo as you like and save as GIF, PNG and Grayscale GIF for CSS printing. I also customized the output message. If you want to do the same or edit other messages, you can find the message.inc file in the /program/localization/en/ directory. Edit the Messages['loggedout'] entry as you like, then save it. Mine now says "You have successfully logged out of PaulStamatiou.com". Goodbye! Fini, I hope you learned as much about RoundCube as I did while writing this. Today was my first touch on RoundCube, so this is all new to me too. I really think RoundCube has a lot of potential. Given the active developer community at SourceForge, I expect RoundCube will soon catch up with competing webmail apps. It breaks the door to the industry standard SquirrelMail, which has an awkward user interface. If you liked this article, please contact me. I love listening to my readers. I'm always open to suggestions for reviews or how-to articles. If you have additional questions about RoundCube, the RoundCube forum is an excellent resource. Here is an adaptation of my article on configuring RoundCube on FreeBSD. FreeBSD.
